**1UE Shield box MIMO & OTA
XCAT-SmartShield**

Early smartphones featured direct antenna ports for easy RF diagnostics. Today's sealed designs have removed that luxury, creating a major barrier for RF engineers.

XCAT-SmartShield solves this with advanced Over-The-Air (OTA) technology. Test the latest devices with high precision—no physical ports required.

Engineered for a perfect RF environment. Its superior shielding and antenna configuration ensure minimal path loss and maximum reliability for every test result.

5G devices run hot, often throttling performance mid-test. Our integrated cooling system mitigates thermal issues, ensuring stable results over long-term testing.

Combined with XCAT-MAIS (Massive MIMO Air Interface Simulator), it effectively eliminates cross-talk between UE ports. The ultimate setup for 5G testing accuracy.
