**Auto emergency Call test
XCAL-eCall**

As vehicles become increasingly connected, emergency communication must be faster and more reliable. eCall is an in-vehicle system that automatically or manually alerts emergency services after a car crash

eCall validation has long relied on manual testing. XCAL-eCall changes that with fully automated testing and verdicts, delivering consistent, standards-based results.

XCAL-eCall is a complete validation environment, combining XCAL-eCall software with GPS, ECU, and PSAP emulators to accurately simulate real-world accident scenarios under controlled conditions.

Accident scenarios are visualized through graphical simulations on GPS-based virtual maps, enabling intuitive validation of location, movement, and emergency call behavior.
